**NEW QUESTION: 3**

Examine the output of the following commands:

Which statement is true concerning these resource controls settings?

- A.** The zone.max-lwps resource control was set to its value when the zone.max-processes resource control was set to its value.
- B.** The zone.max-processes resource control will deny zombie processes from exhausting the resource table.
- C.** The prctl command can be used to change the max value for these resource controls.
- D.** The zone.max-lwps resource control will deny zombie processes from exhausting the process table.

**Answer: B**

Explanation:

Explanation/Reference:

\* zone.max-processes

Maximum number of process table slots simultaneously available to this zone.

Because both normal processes and zombie processes take up process table slots, the max-processes control thus protects against zombies exhausting the process table. Because zombie processes do not have any LWPs by definition, the max-lwps control cannot protect against this possibility Note:

\* prctl - operations on a process

Use the prctl command to make runtime interrogations of and modifications to the resource controls associated with an active process, task, or project on the system.

#### NEW QUESTION: 4

A. Option D

B. Option C

C. Option B

D. Option A

**Answer: D**

Explanation:

As an enhancement to EAP-FAST, a differentiation was made to have a User PAC and a Machine PAC.

After a successful machine-authentication, ISE will issue a Machine-PAC to the client. Then, when processing a user-authentication, ISE will request the Machine-PAC to prove that the machine was successfully authenticated, too. This is the first time in 802.1X history that multiple credentials have been able to be authenticated within a single EAP transaction, and it is known as "EAP Chaining".
