Besides, we should tell you that the contents of [H31-523 V2.0](#) the three versions are the same, Our sincerity stems from the good quality of our products, H31-523\_V2.0 Soft test engine stimulates the real environment of the exam, and you can know what the real exam looks like through this version.

About our valid H31-523\_V2.0 exam questions and answers, Once you become our users of purchasing our H31-523\_V2.0 study materials you will have priority to get our holiday discount.

We will be responsible for our H31-523\_V2.0 : HCSE-Cloud DataCenter Operations (Written) latest questions which means the content of our Huawei-certification H31-523\_V2.0 study guide will continue to update until the end of the examination.

If you decide to join us, you just need to spend your spare time to practice valid H31-523\_V2.0 vce file, which contains detailed explanation and valid H31-523\_V2.0 dumps with answers.

First of all, our H31-523\_V2.0 study dumps cover all related tests about computers, Valid H31-523\_V2.0 study guide files will help you clear exam one-shot, it will be fast for you to obtain certificates and realize your dream.

#### NEW QUESTION: 1

Which of the following are the correct statements about the H31-523\_V2.0 exam? (Select two)

A. The H31-523\_V2.0 exam is a multiple-choice exam.

B. The H31-523\_V2.0 exam is a written exam.

C. The H31-523\_V2.0 exam is a practical exam.

D. The H31-523\_V2.0 exam is a simulation exam.

Answer: A,C

**Answer:**

Explanation:  
Explanation

Storage location: Azure Blob Storage  
Archiving method: A lifecycle management policy  
Azure Blob storage lifecycle management offers a rich, rule-based policy for GPv2 and Blob storage accounts. Use the policy to transition your data to the appropriate access tiers or expire at the end of the data's lifecycle. The lifecycle management policy lets you:  
\* Transition blobs to a cooler storage tier (hot to cool, hot to archive, or cool to archive) to optimize for performance and cost  
\* Delete blobs at the end of their lifecycles  
\* Define rules to be run once per day at the storage account level  
\* Apply rules to containers or a subset of blobs  
Reference:  
<https://docs.microsoft.com/en-us/azure/storage/blobs/storage-lifecycle-management-concepts>

**NEW QUESTION: 3**

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. You have an Azure subscription that contains the following resources:  
\* A virtual network that has a subnet named Subnet1

- \* Two network security groups (NSGs) named NSG-VM1 and NSG-Subnet1
- \* A virtual machine named VM1 that has the required Windows Server configurations to allow Remote Desktop connections

NSG-Subnet1 has the default inbound security rules only. NSG-VM1 has the default inbound security rules and the following custom inbound security rule:

- \* Priority: 100
- \* Source: Any
- \* Source port range: \*
- \* Destination: \*
- \* Destination port range: 3389
- \* Protocol: UDP
- \* Action: Allow

VM1 connects to Subnet1. NSG1-VM1 is associated to the network interface of VM1. NSG-Subnet1 is associated to Subnet1.

You need to be able to establish Remote Desktop connections from the internet to VM1.

Solution: You modify the custom rule for NSG-VM1 to use the internet as a source and TCP as a protocol.

Does this meet the goal?

**A.** No

**B.** Yes

**Answer: A**

Explanation:

NSGs deny all inbound traffic except from virtual network or load balancers. For inbound traffic, Azure processes the rules in a network security group associated to a subnet first, and then the rules in a network security group associated to the network interface.

By default NSG rule to allow traffic through RDP port 3389 is not created automatically during the creation of VM, unless you change the setting during creation. Subnets usually do not have any NSG associated unless you go out of the way to do so, which this scenario does. When you create that extra NSG, it won't have an RDP rule by default, thus blocking inbound connections.

Request first goes to NSG -subnet1 and as there is no allow rule for RDP so it will block the request by default. Since the Subnet NSG (the one with the default rules) is evaluated first, it blocks the inbound RDP connection.
