NEW QUESTION: 4
What can cause missing SSL packets when performing a packet
capture on dataplane interfaces?
A. The packets are not captured because they are encrypted.
B. There is a hardware problem with the offloading FPGA on the
management plane.
C. The missing packets are offloaded to the management plane
CPU.
D. The packets are hardware offloaded to the offload processor
on the dataplane.
Answer: D
Explanation:
Explanation/Reference:
Packet captures on a Palo Alto Networks firewall are performed
in the dataplane CPU, unless you configure the firewall to Take
a Packet Capture on the Management Interface, in which case the
packet capture is performed on the management plane. When a
packet capture is performed on the dataplane, during the
ingress stage, the firewall performs packet parsing checks and
discards any packets that do not match the packet capture

filter. Any traffic that is offloaded to the field-programmable gate array (FPGA) offload processor is also excluded, unless you turn off hardware offload. For example, encrypted traffic (SSL/SSH), network protocols (OSPF, BGP, RIP), application overrides, and terminating applications can be offloaded to the FPGA and therefore are excluded from packet captures by default.
