So with the help of our EX310 updated questions, there will be no hard nut for you to crack.

NEW QUESTION: 1

If a CPL rule contains more than one trigger, how are the triggers evaluated?

- A. They are logically ANDed together; all of them must be true for the rule to match.
- B. They are logically ORed together; any one of them must be true for the rule to match.
- C. Only the last trigger is evaluated.
- D. Only the first trigger is evaluated.
- E. The answer depends on the type of layer.

Answer: B

NEW QUESTION: 2

The S bit in the MPLS header is used for what purpose?

- A. To indicate the bottom level in the label stack
- B. To indicate the status of the LSP
- C. To indicate if LDP is sync to the IGP
- D. To indicate if LDP is sync to the IGP

Answer: A

Explanation:

a 1-bit bottom of stack flag. If this is set, it signifies that the current label is the last in the stack.

NEW QUESTION: 3

Pilot testing of the new switching infrastructure finds that when the root port is lost, STP immediately replaces the root port with an alternative root port. Which spanning-tree technology is used to accomplish backup root port selection?

- A. UDLD
- B. PVST+
- C. PortFast
- D. Loop Guard
- E. BackboneFast
- F. UplinkFast

Answer: F

Explanation:

Explanation/Reference:

Explanation:

If a switch loses connectivity, it begins using the alternate paths as soon as the spanning tree selects a new root port. By enabling UplinkFast with the spanning-tree uplinkfast global configuration command, you can accelerate the choice of a new root port when a link or switch fails or when the spanning tree reconfigures itself. The root port transitions to the forwarding state immediately without going through the listening and learning states, as it would with the normal spanning-tree procedures.

UplinkFast provides fast convergence after a direct link failure and achieves load balancing between redundant Layer 2 links using uplink groups. An uplink group is a set of Layer 2 interfaces (per VLAN), only one of which is forwarding at any given time. Specifically, an uplink group consists of the root port (which is forwarding) and a set of blocked ports, except for self-looping ports. The uplink group provides an alternate path in case the currently forwarding link fails.
